

Calculation of ground length of optical cable

Overview

Fiber length takeoff starts with a measured route. Break the pathway into segments for tray runs, conduit sections, risers, and underground ducts. All lengths are calculated in a base unit, then converted. Reel count is $\text{ceil}(\text{Total} \div \text{ReelSize})$, and the rounded order length equals $\text{Reels} \times \text{ReelSize}$. Set routing slack to cover bends and alignment. In this paper, the optimal fiber length in optical ground wire (OPGW) cable during production process is determined. The results show that in OPGW cable, if the fiber stranding length is less than the maximum lay length, the ultimate tensile stress (UTS) percentage decreases, but if it is higher. As enterprise and hyperscale data centers scale rapidly to support 800G and 1.6T Ethernet standards in 2026, the pre-terminated MPO trunk cable remains the critical physical backbone of the optical network. This section defines the requirements for G.
