

Connect the front and rear switches respectively

Overview

You can join all 4 inputs together through diodes if you want to control your front and rear windows from a single parallel switch. This same approach can be used for other switches like your lighting. Turn Signal Switch: This switch is typically located on the steering column and is used to activate the signal lights. It controls the flow of current to the lights based on the driver's input. Fuse: The fuse protects the signal light. Our Infinitybox system is the most powerful and flexible wiring harness available in the market. Our MASTERCELL inputs are flexible and adaptable for practically any application. This diagram is commonly used in industries and households where machines or equipment need to operate in both forward and. The switch should maintain contact for at least 50 ms to signal the power supply to switch on or off. their actual dimensions are 4" wide by 1" high.
