

Does the communication optical cable use redundant configuration

Overview

Fiber rings refer to configurations or architectures used in fiber optic networks, often employed in telecommunications to ensure high-speed data transmission with redundancy and reliability. A fiber optic ring network is a physical or logical network topology where devices (usually switches) are connected in a closed-loop using fiber optic cables. Each node is connected to two other nodes, forming a ring-like structure. This design ensures data can travel in both directions. Understanding fiber rings and related terms is crucial for anyone involved in network design. The fiber optic ring redundancy design for industrial Ethernet switches is precisely engineered to address this pain point—achieving millisecond-level fault self-healing through the synergy of physical ring architecture and intelligent protocols, thereby constructing the "self-healing heart" of. There are many different ways to enhance fiber redundancy in a network.
