

# Explosion-proof power distribution in Venezuela

## Overview

The energy infrastructure in Venezuela is marked by three main challenges: outdated generation plants, unreliable transmission networks, and widespread inefficiencies in distribution. A mix of hydroelectric and thermal plants powers the country. At the turn of the century, the 30-second elevator pitch for Venezuela's electricity sector was compelling: one of the best integrated electricity systems in Latin America, with more than 30 GW of state-of-the-art hydroelectric and thermal generation, around 30,000 kilometers of transmission lines. Caracas, Venezuela, 2026-04-27 — / EPR Network / — Venezuela's largest oil refinery has successfully installed a new LED explosion-proof lighting system across its production and processing areas. The upgrade aims to enhance the refinery's safety standards while reducing energy consumption and. Electricity can be generated in two main ways: by harnessing the heat from burning fuels or nuclear reactions in the form of steam (thermal power) or by capturing the energy of natural forces such as the sun, wind or moving water. The situation stems primarily from the severe decline in hydroelectric generation capacity, which traditionally accounts for approximately 60% of Venezuela's. uct (GDP). Consequently, the rest of itiveness. sanctions have discouraged foreign nentially.
