

Fiber optic distribution frames are divided into racks

Overview

Typically built for 19-inch racks, rack-mounted ODFs offer modularity and scalability. Their sturdy frames and slide-out trays allow technicians to manage fibers conveniently while accommodating future growth. ODFs are typically divided into three structural types, each suitable for different deployment scenarios: Compact and box-shaped, wall-mounted units are ideal for small-scale fiber terminations in offices, residential networks, or areas with limited space. They support a relatively low fiber count. In the complex architecture of fiber optic networks, the Optical Distribution Frame (ODF) serves as the linchpin for organizing, protecting, and distributing optical signals. As data centers, enterprises, telecom operators, and smart-building infrastructures deploy increasingly dense fiber links, ODFs provide the structured. The 19-inch standard, commonly used in rack-mounted equipment such as ODFs, refers to the standardized width of the equipment. 19-inch denotes the horizontal measurement between the mounting holes on the equipment's front panel.
