

Future High-Code Wavelength Division Multiplexing Systems

Overview

Here, we develop a novel design approach that co-optimizes inverse-designed wavelength division multiplexers and distributed Bragg gratings to achieve ultra-low crosstalk without compromising insertion loss. This co-optimized platform enables efficient routing of multiple light signals across different wavelengths. ♦ By mounting and connecting 12-coupled-core multicore fibers with the same diameter as existing optical fibers suitable for mass production to commercial high-density multicore cables, and by developing large-scale MIMO signal processing technology, high-capacity long-distance transmission over. Wavelength division multiplexing (WDM) technology is a game-changer in the world of telecommunications. It allows multiple signals to be transmitted over a single optical fiber, significantly increasing the capacity and efficiency of data transmission.
