

How many tertiary circuits can be connected to a secondary distribution box

Overview

The general rule in the parent text of 225. 30 is to allow a building or structure to be supplied by no more than one branch circuit or feeder. From there, it is routed to individual building distribution boxes (secondary distribution boxes), which subsequently supply power to unit-level distribution boxes (tertiary distribution boxes), and finally to household systems. Key Characteristics: Typically acts as the main distribution point for. Where feeder conductors originate in the same panelboard, switchboard, or other distribution equipment, and each feeder terminates in a single disconnecting means, not more than six feeders shall be permitted. Code Change Summary: New code section permits more than one feeder to supply a building. For example, in a newly built residential area with a 10kV incoming line and a distribution room, power is distributed from the low-voltage end of the transformer at 0.
