

How to check the IP address of the access switch

Overview

Open the Command Prompt by pressing the Windows key + R, typing "cmd" in the Run dialog, and pressing Enter. Scroll through the results until you find the network adapter that is connected to your switch. While it might seem like a technical hurdle, several straightforward methods can help you uncover this essential piece of information. My predecessor was managing them, unfortunately, when I inherited them I got zero information about it and. What I'm doing at the moment is: Run nmap (meh.) with just ping scan on the whole subnet (or scanning for telnet, since the switch has this port open) and afterwards check the ARP cache and retrieve the IP by checking against the MAC address, since I know what manufacturer part to look for. If there comes a situation where I need to know the IP addresses of the devices connected to either Switch A or B, what would be the right way to find it?

I know that if I run the command Show Arp, it would display the MAC and IP addresses of the End devices, but it can be run only on the Core. The IP address allows you to access the switch's management interface, where you can configure settings and diagnose problems.
