

# How to use the computing card AI server

## Overview

In this video, we showcase a high-end server setup designed for maximum GPU computing performance:  Hardware Overview: CPU: Intel i9-7900X Motherboard: Supermicro X299 GPU: 4x NVIDIA Tesla V100 32GB SXM2 Memory: 128GB (4x32GB) DDR4 RAM Storage: Samsung 990 PRO 1TB NVMe M. 2 SSD. Qualcomm Technologies is demonstrating a rack-level AI inference system at MWC 2026, integrating acceleration, memory, interconnect and management software into a cohesive, deployment-ready platform. Hardware, connectivity and software come together as a single data center platform, designed to. Getting your own multi-GPU EdgeAI server isn't just a fun project; it's a smart investment. This article dives into why a purpose-built EdgeAI machine can outperform traditional cloud solutions and provides a step-by-step guide to building a powerful, dual-GPU system. This configuration ensures maximum interconnect speed for all eight GPUs. But what makes GPUs so well-suited for this task?

The answer is in the fundamental differences between CPUs and GPUs. While Central Processing Units (CPUs) and Graphics Processing Units (GPUs) are processors. The edge refers to computational processes occurring close to the data sources at these locations – be they sensors, devices, or end-users – rather than relying on centralized systems that are common in traditional AI processing. This unlocks hyper-personalized experiences such as dynamic menu.
