

Is an optical switch a type of device

Overview

An optical switch is a device engineered to selectively redirect incoming optical signals from one fiber-optic input port to a chosen output port. The basic principle behind an optical switch is to control the direction of light propagation through various mechanisms, such as mechanical movement, electro-optic effects, or thermo-optic. Optical switching is the process of controlling the destination of individual optical information signals. This technology allows for high bit rate transmission to be switched between various optical lines. Figure: Optical Switch. □□ For purchasing, use the RP Photonics Buyer's Guide for optical switches.
