

Multiple PLCs connected to the switch

Overview

In this video, we show you how to connect multiple PLCs to a single HMI and how to connect multiple HMIs to one PLC using Siemens TIA Portal. There is a use of four toggle switches to control four motors. If Switch 1 is ON, then Motor 1 will be ON. You would then configure the router's NAT mapping to map your 192. For example, Company A's driver (serial communication) is set to COM1 and Company B's driver is set to COM2 (serial communication). However, each COM port can only have a single driver. Each panel operates independently and includes its own network devices such as PLCs, HMIs, VFDs, etc. Now, we plan to connect all panels to a central server. One-to-many Network Area Translation (NAT), which may also be referred to as Port Area Translation, is a networking service that allows one static public IP address (the "one") to be accessed by many private IP addresses (the "many"), allowing communication between multiple devices on different.
