

Plug-in optical splitters affect network performance

Overview

Where splitters are placed in the network can make significant impacts on fiber counts, network cost and deployment time and operational steps, such as customer onboarding and maintenance. A fiber broadband provider typically determines and overall split ratio for the network, such as 1x32 or 1x64, and uses combinations of splitters to meet that ratio with each PON port. 1x32 splits were common in North America for G-PON architectures. As XGS-PON continues to be adopted, some service. In the backbone of modern Fiber-to-the-Home (FTTH) networks, optical splitters serve as the unsung heroes that enable cost-efficient connectivity for millions of subscribers. Conversely, it can also combine multiple signals into one. By dividing a single optical signal into multiple outputs, ABS PLC splitters allow seamless connectivity across a wide.
