

PoE switch frequently loses power

Overview

Check PoE Budget: Ensure the PoE switch or injector has enough power budget to support all connected devices. Here are some common PoE issues and how to troubleshoot them: 1. Insufficient Power Delivery. In a basic PoE power supply system, the major components are the power sourcing equipment (PSE), the powered device (PD), and the PoE cables. When a problem occurs with PoE, in most cases, the error symptom can be simply shown as the PoE switch not providing power, and the powered devices will stop. We have experienced several switches losing all Power over Ethernet (PoE) functionality, which resulted in a complete loss of VoIP service within the affected building. Despite this, POST and all hardware indicators display normal operation. However, when PoE fails, it can disable critical infrastructure like IP phones, wireless access points, and security cameras. This guide provides a step-by-step troubleshooting. This document aims to help provide a basic understanding of how PoE is provisioned on MS switches and some troubleshooting steps to help identify issues with PoE failure on a switch or switch ports. PoE calculation is done during initial link negotiation. Firmware Errors - Check on the device if there are any.
