

## Results of relay protection operation

### Overview

A protective relay operates by continuously monitoring electrical parameters, detecting abnormalities, making decisions, and triggering circuit breakers to isolate faulty sections. This process helps protect equipment, maintain power system stability, and ensure safety for. Protective relays and devices have been developed over 100 years ago to provide “lastline” of defense for the electrical systems. They are intended to quickly identify a fault and isolate it so the balance of the system continue to run under normal conditions. Long term cost reduction (TCO) for trainings and maintenance by reduce variety of relays A fast and selective arc fault mitigation for air-insulated LV & MV switchgear and Relion protection and control relays and sensor. Protective relaying aims to stop that chain reaction before it starts, detecting problems instantly, cutting off the affected section, and keeping the rest of the system stable and safe. These devices detect abnormal operating conditions and initiate protective actions to isolate faults and prevent equipment damage. However, to ensure the. rectly reflected as an improvement in customer service.
