

Span Requirements for Multimode Fibers

Overview

Multimode fibers are categorized into OM1, OM2, OM3, OM4, and OM5, each with different bandwidth and distance capabilities. For example: OM1 and OM2: Support distances up to 300 meters at 1 Gbps. This Applications Engineering Note (AE Note) discusses the criteria for properly selecting the optimal multimode fiber (MMF) for enterprise applications. Multimode Fiber (MMF) has a core diameter, typically 50–100 micrometers, has ability to transfer multiple modes of light through the fiber core, uses lower-cost electronics (LED, VCSEL) operates at. Singlemode and multimode fiber both supports speeds of 1 to 800 Gig. Dispersion limits fiber optic transmission distance by causing signal distortion and is classified into chromatic dispersion, modal dispersion, and polarization mode dispersion (PMD). Modal dispersion This significantly. Multimode fiber (MMF) is an optical fiber designed to carry multiple light propagation paths—or modes—simultaneously. This is made possible by its relatively large core diameter, typically 50 or 62.
