

Transformed into a test optical module for light reception

Overview

An optical transceiver module, often simply called an optical module, acts as a signal conversion interface in fiber optic networks. This includes signal testing with multiple interfaces and protocols, module light emission and reception testing, optical performance testing, and port testing and cleaning solutions. Among various optical module form factors, SFP (Small Form-Factor Pluggable). The EM203 Optical Module EMI Test Platform is a test system for qualifying optical modules for Radiated Emissions EMC test compliance. The platform doubles as both a reference signal source for verifying the Radiated Emissions test chamber and a test fixture and variable power supply and state. In fiber optic networks, optical transceivers such as SFP, SFP+, QSFP28, and QSFP-DD play a vital role in converting electrical signals into optical signals and vice versa.
