

Voltage busbar at the top of the switchgear cabinet

Overview

The horizontal busbar system of metal-enclosed switchgear is usually situated towards the top of the cubicle enclosure. In low-voltage power distribution, the cabinet is never just a cabinet, and the busbar is never just a strip of copper. Behind every reliable low voltage switchgear lineup is a design balance that is harder than it first appears: current must flow safely, heat must be controlled, internal space. Busbar design within Medium Voltage (MV) switchgear is a critical aspect, fundamentally ensuring the safe, reliable, and efficient operation of power systems. A busbar is a metal bar, usually made of copper or aluminum, that carries electricity inside switchgear. It connects. The switchgear is provided with a continuous electrolytic copper earth-ing busbar, with a cross-section suit-able for the proper switchgear short-circuit rating and pre-set on both sides for connection to the earthing network.
